Wind Direction(Degree)	33	53	28	60	55
Cloud Cover(Octa)	3	3	3	3	3

Weather Summary/Alert:

• As per the blocklevel value added forecast given by, IMD, RMC, Nagpur, sky will be clear to partly cloudy during next five days i.e., 13th to 17th, January, 2024. • Weather is likely to be dry on 13th, 14th, 15th, 16thand 17th, January, 2024. • No large change in maximum temperature during next 5 days over the Vidarbha. • Minimum temperature falls by 2-3 degree Celsius during next 3 days thereafter no large change over the Vidarbha.

General Advisory:

• Considering the dry weather forecast for next 5 days it is advised to continue the harvesting and threshing of matured pigeon pea and others crop. • In view of the expected fall in minimum temperature, seasonal, fruits and vegetable crops should be irrigated lightly by drip irrigation/sprinkler irrigation methodto reduce the cold injury at critical growth stages. • Crops should be mulched for orchards and vegetable crops, so that it helps to increase the temperature of the soil and conserve soil moisture. • It is advised for farmers to carry out the remaining picking of cotton and terminate the crop after last picking to avoid PBW attack in next season. Collect and destroy the boll rot and diseasedcrop debris outside the field. • It is advised to continue the agrochemical spraying operations, intercultural operations and fertilizer application in standing crops. • For integrated management of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromone traps (Hexalur) two per acre or five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of neem extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emamectin benzoate 5 % SG 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at late jointing stage (45 to 50 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85) days after sowing) to the wheat crop.

SMS Advisory:

• Irrigate the crop as per crop requirement with the sprinkler irrigation system possibly and care should be taken that the irrigation water does not accumulate in the crop field.

Crop Specific Advisory:

Crop(Varieties)	Crop Specific Advisory
GROUNDNUT	If irrigation water is available, summer groundnut should be sown in the second fortnight of January under Broad bed furrow system and sprinkler irrigation system should be used. Use 125 kg seed per hectare of TAG-24 or SB-11 variety. Seed treatment of Trichoderma 5 gm, Rhizobium 25 gm, and PSB 25 gm should be done per kg of seed. In summer season groundnut variety TAG-24 should be sown at 30 x 10 cm and SB-11 at 30 x 15 or 45 x 10 cm for sowing.
PIGEON PEA (RED GRAM/ARHAR)	• Complete the harvesting of matured pigeon pea crop and store the harvested and threshed produced in safe and dry places.
BENGAL GRAM/ CHICK	• For optimumyield in gram crop, the first irrigation should be given 30 to 40 days after sowing i.e. when the crop is in flowering stage and the second irrigation should

be given 60 to 70 days after sowing i.e. in the pod filling stage. *I to prevent the occurrence of will desease in grame roop avoid access irrigation to avoid water sugmation in crop field and drenching of Trichoderma biological fungicide mixed with 40 grams per 10 liters of water should be spayed or drenched or thiophanate methyl 70 WP 25 grams mix with 10 liters of water should be spayed or drenched or thiophanate and the properties of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromone traps (Hexalur) two per acre of five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crops in 40 to 30 *4 flowering stage, preference should be given to batanicals or hiological pesticides. For this, first spraying should be taken on tene cartact 5% or Acadimeta 30 by \$4 flowering stage, preference should be given to batanicals or hiological pesticides. For this, first spraying should be taken on tene cartact 5% or Acadimeta 30 by \$4 flowering stage, preference should be given to batanicals or hiological pesticides. For this, first spraying should be taken of necessary and the stage of the properties of the properties of the first stage of the properties of the first stage of the stage of the properties of the first stage of the stage of the first stage of the first stage of the first stage of the	Crop(Varieties)	Crop Specific Advisory
occurrence of wilt disease in gram crop avoid excess irrigation to avoid water with 40 grams per 10 liters of water should be sprayed or drenched or thiophanate methyl 70 WP 25 grams mix with 10 liters of water should sprayed. For integrated management of Gram Pod Borer 20 bird perches per hecture, 15 or integrated management of Gram Pod Borer 20 bird perches per hecture, 15 or integrated management of Gram Pod Borer 20 bird perches per hecture, 15 or integrated management of Gram Pod Borer 20 bird perches per hecture, 15 or integrated management management management management because should be install up in the field. For control of gram pod borer install phormone trags (Hexalut) two per acre or five per hecture. 16 right to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of post intestation by observing the cop or when the crop is in 40 to 50 % flowering stage, preference should be given to butanicals or biological pesticides. For this, first spraying should be to the wind the proper should be trap for the stage of the power part of the stage of the stage of the power party and proved proper pump. 16 praying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, parying should be done with Quinaphox 25 WE CO ml or Emanuectin benzonte 5 % 63 gr or Pubendamide 20 % WG 5 gn or Chloratrantiphore 18.5 % C.2 ml per 10 liters of water. At Wafe candition hoeing and weeding must be carried out wice; first at 20 and second at 30 days old plants to ensure weed fere environment during the critical period of recop weed competition for better water and marient time at efficiency. **Wheat crop should be trappated first at 18 to 20 days after sowing at single irrigation is available, irrigate at 21 and 65 days after sowing in the percentage of the party of the consideration should be apply at a form		
with 40 grams per 10 liters of water should be sprayed or drenched or thiophamate methyl 70 WP 25 grams mix with 10 liters of water should sprayed. For integrated management of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromone traps (Fexular) two per acro of five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of post indistation by observing the crop or when the crop is in 40 to 50 % flowcring stage, preference should be given to botanicals or biological pesticies. For this, first spraying should be to face of the previous previous of the power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETI, spraying should be fore with Quinalphox 52 % EC 20 ml or Emamertin benzoate 5 % SG 3 gm or Flubendiamide 20 % WG 5 gm or Chloratmanilippor 18.8 SC 2.5 ml per 10 liters of water At Wahs condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and mutrient use efficiency. **Wheat crop should be trigated first at 18 to 20 days after sowing if single irrigation is available, trigate at 21 and 65 days after sowing if single irrigation is available, trigate at 21 and 65 days after sowing, if the variety of three irrigations available, regate at 21, 42 and 65 days after sowing, but this rigation should be apply at the climiting stage (65 to 70 days after sowing), flourth irrigation should be papty at the powering stage (65 to 70 days after sowing). For this regation should be papty at the intimity stage of the 50 days after sowing, but this regation should be papty at the individual one 2.5 % EC 40 ml per 10 liters of water for management. In wheat crop be to cloudy weather, in case of infestation of palse is wheat crop. I make a poisonous bait, mix 40 parts of the say water of		occurrence of wilt disease in gram crop avoid excess irrigation to avoid water
methyl 70 WP 25 grams mix with 10 liters of water should sprayed. For integrate in the field. For control of gram pod borer 20 bird percises per hectares life glid. For control of gram pod borer install pheromone traps (Hexalur) two per acre of five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken of neme curton 15% or Azadiractin 300 ppm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be taken of neme extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % IC 20 ml or Emanuerch benzoate 5% SG 3 gm or Plabendamide 20 % WC 5 gm or Chlorantraniliprole 18,5 SC 2.5 ml per 10 liters of water. At Wafsa condition hocing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root mitation stage. Water stress at CRI stage reduces production by up to 33 % - Considering the availability of limited irrigation of water crop, irrigate 42 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing showing. Under the availability of adequate irrigation facility, first stringation should be apply at maximum tilering stage (30 to 35 days after sowing), but irrigation should be apply at maximum tilering stage (30 to 35 days after sowing), the fith irrigation should be apply at maximum tilering stage (30 to 35 days after sowing), but irrigation should be apply at maximum tilering stage (30 to 35 days after sowing), the fith irrigation should be apply at maximum tilering stage (30 to 35 days after sowing), the fith irrigation should be apply at maximu		
management of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromore traps (flexalur) two per acre or five per hectare. If eight to exa moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of necen extract 5% or Azadiractin 300 ppm 50 ml per 10 litters of water with Kanpassek sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphoz 25 w EC 20 ml or Emanuectin benzoute 5% SG 3 gm or Flubandiamide 20 % WG 5 gm or Chlorantramiphore 18.5 SG 2.5 ml per 10 litters of water. At Wafsa condition boeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. **Wheat crop should be irragiated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. *Considering the availability of limited irrigation for wheat crop. irrigate 42 days after sowing; if single irrigation is available, and if three irrigation available irrigate at 21.4, 24 and 56 days after sowing, fourth irrigation should be apply at the jointing stage (30 to 35 days after sowing), second irrigation should be apply at the jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at the jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at the jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at the jointing stage (30 to 35 days after sowing). The proper stage is a stage of the grain of the grain of the grai		
acre or five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological posticides. For this, first spraying should be taken of necm extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Kanpasuk sprayer pomp. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a power of the control of the contr	1	management of Gram Pod Borer 20 bird perches per hectare should be install up in
consecutive days, recommended management measures should be taken in her corp is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of necen extract 5% or Azadinetia 300 ppm 50 ml per 10 liters of water with Kanpsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emanuectin benzoate 5 % SG 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18,5 SC 2.5 ml per 10 liters of water. At Wafsa condition hocing and weeding must be carried out twice; first at 20 and second an 30 days old plants to nesure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. * Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stross at CRI stage reduces production by up to 33 %. * Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing. * Single Irrigation is available; irrigate at 21 and 56 days after sowing. * Limited the availability of adequate irrigation ficelity, first irrigation should be apply at maximum tilering, stage (35 to 35 days after sowing), thrici irrigation should be apply at maximum tilering, stage (30 to 35 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing). The properties of the water of the soving of the soving of the water of the soving of the sovi		
pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of neem extract 5% or Azadiracin 300 ppm 50 ml per 10 liters of water with Kanpasek sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a control of the control of the period of the period of the control of the control of the period of the control		
spraying should be taken of neem extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Kanpasek sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinaphose 25% BC 20 ml or Emamercitin benzoute 5% BC 3 gm or Flubendiamide 20 % WC 5 gm or Chlorantarialiprole 18.5 SC 2.5 ml per 10 liters of water. At Wafas condition hocing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutricul use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stross at CRI stage reduces production by up to 33 % Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing; a wing irrigation is available, and if three irrigation available irrigate at 21 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at maximum litering stage (36 to 36 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheater crop. In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 23% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water foxing with the strong of the productive of the control of the strong o		
licros of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % IE 20 ml or Emamentin henzoats 5 % 68 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Walsa condition hocing and woeding must be carried out twice, first at 20 and second at 30 days oft plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. **Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. *Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of indeption and interest at 21 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at rown root initiation stage (18-20 days after sowing), second irrigation should be apply at the attachment of the sowing. North irrigation should be apply at the flowering stage (30 to 35 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing). Fig. 11 mease of infestation of applies in wheat crop. **In case of infestation of applies in wheat crop is notice due cloudy weather, rances of infestation of applies in wheat crop is notice due cloudy weather, rances of infestation of palpids in wheat crop is notice due cloudy weather, rances of infestation of palpids in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 10 to		
power sprayer, apply three times the amount of posicide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emameetin benzoute 5 % 8 G 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantralliprole 18, 52 C 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutricul use efficiency. • Wheat crop should be irrigated frist at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. • Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing after sowing if single irrigation is available, irrigate at 21, 42 and 65 days after sowing. • Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at most must utilize the stage (30 to 35 days after sowing), third irrigation should be apply at the flowering stage (65 to 50 days after sowing). On the wheat crop. • In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or 20 uniaphos 25 % EC 40 ml per 10 liters of water 57 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible of 10 and 1 part of hormadiolene 0.25 % CE. 8 ponon the bait into a plastic bag and place it in a live field bin or near the bin. • Cloudy weather and lowering stage, for availability of more irrigation schedule it at 30 days interval. • Considering the dry weather forecast, undertake need based irrigation for higher productivity in mustard. In case of availability of one irrigation s		
reached the ETL. spraying should be done with Quinalphos 25 % BC 20 ml or Emamentin benzoate 5 % 86 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Walsa condition hocing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. **Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. *Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21 and 65 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. *Londer the availability of adequate irrigation fall system sowing, second irrigation should be apply at the attack of days after sowing, second irrigation should be apply at the flowering stage (36 to 30 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), and the stage of the grain (80 to 85 days after sowing) to the wheat crop. **In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxan 25% WG (@ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of mst and lead blight disease is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make notice spray with this method and the supplies of the period of the period of the period of the period of the perio		
Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Walsa condition boeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21 and 63 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at trown root initiation stage (18-20 days after sowing), second irrigation should be apply at the atte jointing stage (50 to 30 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. • In case of infestation of aphids in wheat crop due to cloudy weather, pray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spaying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait mix 49 parts of cereal flour, a little bit of dolibe oil and 1 part of bromadiolone 0.25 % CBs. Spoon the bai	1	
and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. *Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. *Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at neximum tillering stage (30 to 35 days after sowing), fourth irrigation should be apply at the filowering stage (45 to 50 days after sowing), the filth irrigation should be apply at the milky stage of the grain (80 to 85 days) after sowing), the filth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the filth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), and the sowing of the grain (80 to 85 days) after sowing to the wheat crop. **In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water from anagement. In wheat crop the to cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 flour, a little bit of edible to 10 z5 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible to 10 z5 gm per 10 liters of water. Toxic bait should be used for the mixed of the providence of the providence of the providence of the proot of the providence of the providence of the providence of the		
ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. *Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CR1 stage reduces production by up to 33 %. *Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available; irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the wheat crop. *In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop the to cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flowr, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB spoon the bait moto a plastic bag and place it in a live field bin or near the bin. **Oloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water. Undertake need based irrigation schedule it at 30 days and flowering stage, for availability of two irrigations schedule it at 30 days and		
WHEAT WHEAT crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing), but crown root initiation stage (18-20 days after sowing), second irrigation should be apply at crown root initiation stage (18-20 days after sowing), furth irrigation should be apply at the flowering stage (65 to 70 days after sowing), furth irrigation should be apply at the flowering stage (65 to 70 days after sowing), furth irrigation should be apply at the flowering stage of the grain (80 to 85 days after sowing), fourth irrigation should be apply at the flowering stage of the grain (80 to 85 days after sowing), fourth irrigation should be apply at the flowering stage of the grain (80 to 85 days after sowing) to the wheat crop. **In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop be to cloudy weather, in case of infestation of rust and leaf hight disease is notice spraying should be done of Manozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Olond weather and between in gibt temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water. Undertake need based irrigation schedule it at 10 days and howering stage, for availability of two irrigations schedule it at 30 days and sta		·
initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigate at 21 and 65 days after sowing if two irrigation savailable and if three irrigation available irrigate at 21, 42 and 65 days after sowing in the apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at late jointing stage (45 to 50 days after sowing), then irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), tourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), tourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), tourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. *In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 25 gm per 10 liters of water Toxice batt should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live fled bit on rener the bin. *Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoata 30 EC 10 ml per 10 lit of water. Undertake need based irrigation for higher productivity in mustard. In case of availability of one irrigations schedule it at 30 days and flowering stage, for availability of three irrigations schedul		·
Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing; two irrigation is available, irrigate at 21 and 65 days after sowing; Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), their firth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the wheat crop. **In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxan 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water. Undertake need based irrigation for higher productivity in mustard. In case of availability of endingation for higher productivity in mustard. In case of availability of availability of availability of two irrigations schedule it at 30 days and flowering stage, for availability of three irrigations schedule it at 30 days and flowering stage, for availability of two irrigations schedule it at 30 days and solve and schedule sown safflower crop and for above ETL level incidence (30% infested plants)		
after sowing if single irrigation is available; irrigate as 12 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at late jointing stage (30 to 35 days after sowing), their lirrigation should be apply at the flowering stage (56 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (56 to 70 days after sowing), the wheat crop. In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG (10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, spray with Thiamethoxam 25% WG (20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water. Undertake need based irrigation for higher productivity in mustard. In case of availability of ease of availability of a spray and spray of thiometon and the per control of aphid incidence need based irrigation schedule it at 10 ownering stage, for availability of three irrigations schedule it at 30 days and Howering stage, for availability of three irrigations schedule it at 30 days afterval. **Considering the dry weather forecast, undertake need based irrigations schedule it at 50 days crop stage, for availability of two irrigations schedule it at 50 days crop stage, for availability of three irrigations schedule it at 50 days cr		
days after sowing. • Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at the milky stage (30 to 35 days after sowing), fourth irrigation should be apply at the livening stage (30 to 35 days after sowing), fourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the high irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the wheat crop. • In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG (20 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancozeb 75 % WP (@ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. • Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water. Undertake need based irrigation schedule it at 30 days and flowering stage, for availability of three irrigations schedule it at 25 to 30 days interval. • Considering the dry weather forecast, undertake need based irrigation for optimum productivity in safflower. In case of availability of three irrigation schedule it at 30 days crop stage, for availability of three irrigations schedule it at 30 days crop stage, for availability of three irrigations schedule it at 30 days crop stage, for availability of three irrigations schedule		
irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the flower and the fifth of the fift		
second irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at late jointing stage (45 to 50 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic beat should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water. Change the pesticides in subsequent sprays. • Spray gibberellic acid 1.5 g with 1 kg urea in 100 litres water at the time of initiation of Ambia flush.For controlling Phytophthora diseases scrap out gum oozing portion by sharp knife, wash with potassium permanganate solution (10 gms in one litre water) from the infected tree trunk and apply Mefenoxam M Z - 68 (Metalaxyl M 4% + Mancozeb 64 % wp) or fosetyl-Al paste. • If irrigation system is available, sugarcane cultivation should be started by drip irrigation andjoint row method. Intercrops like summer groundnut, onion and cabbage, cauliflower etc. should be taken in sugarcane. • It is advice that in areas where the cotton crop is ready for picking give priority for clean picking of cotton. Keep the picked cotton, variety wise. Use cotton bags instead of gunny or plastic bags for picking and storing of cotton to avoid		
The pest can cause 100 per cent flower drop if not controlled. The pest causes die back and "Greening" disease in affected trees causing slow decline. It can be controlled by spraying Dimethoate 30 EC 2 ml or Acephate 2 g or Imidacloprid 17.8 SL 0.5 ml per litre water at bud burst stage. Second spray should be carried after 10 days interval. Change the pesticides in subsequent sprays. • Spray gibberellic acid 1.5 g with 1 kg urea in 100 litres water at the time of initiation of Ambia flush.For controlling Phytophthora diseases scrap out gum oozing portion by sharp knife, wash with potassium permanganate solution (10 gms in one litre water) from the infected tree trunk and apply Mefenoxam M Z - 68 (Metalaxyl M 4% + Mancozeb 64 % wp) or fosetyl-Al paste. • If irrigation system is available, sugarcane cultivation should be started by drip irrigation andjoint row method. COTTON instead of gunny or plastic bags for picking and storing of cotton to avoid	•	• It is advice that in areas where the cotton crop is ready for picking give priority for
contamination of the lint. • Farmers are advised to complete picking of cotton the		contamination of the lint. • Farmers are advised to complete picking of cotton the
end of December to avoid PBW attack in next season.		

Horticulture Specific Advisory:

Horticulture(Varieties)	Horticulture Specific Advisory	
WATER MELON	 Sugar Baby, Asahi Yamato, Arka Jyoti, Arka Manik should be selected for watermelon cultivation in summer season. Apply 40 kg N, 40 kg P and 40 kg K at the time of planting. Apply 40 kg N 30 days after planting. 	
MUSKMELON	• Hara Madhu, Pusa Sharbati, Punjab Sunhari, Arka Rajhans, Arka Jeet, Pusa Madhuras should be cultivated for muskmelon crop in summer season. Apply 40 kg N, 40 kg P and 40 kg K at the time of planting. Apply 40 kg N 30 days after planting.	
LINSEED	• Due to continuous cloudy weather condition, sucking pests can be observed, it controlled by spraying thiamethoxam 25% WG 10 to 15 gram or Quinalphos 25% EC 40 ml in per 10 liters of water.	
ONION	• Six to eight week old seedlings of onion crop should be planted in flat beds at a distance of 10×10 centimetres in the first fortnight of January.	
CHILLI	• Cool, humid condition and moderate temperature favours the disease. If the incidence of leaf spot disease is observed on chilli crop, it is advised carry out the spraying of Copper oxychloride 50 % WP @ 1000 gm per acre mix with in 300-400 litre of water or Mancozeb 75 % WP @ 600-800 gm per acre mix with in 300 litres of water or Hexaconazole 75 % WG @ 27 gm per acre mix with in 200 litres of water or Kresoxim-methyl 15% + Chlorothalonil 56% WG @ 400 gm per acre mix with in 200 litres of water or Carbendazim 12% + mancozeb 63% WP @ 300 gm per acre mix with in 200 litres of water during the clear weather condition.	
BRINJAL	• For management of brinjal fruit and shoot borer Spray Bacillus thuringiensis formulation (1 ml/L) at weekly interval. • Release Trichogramma chilonis @ 2,50,000/ha (50,000/release-5 times at weekly intervals, starting from flowering). Install sex pheromone traps 10/acres. • Spray Chlorantraniliprole 18.5 SC at 0.3 ml/L once in 15 days depending upon the pest population.	
TOMATO	• If the symptoms of Late Blight of tomato was noticed due to the previous cloudy weather, spraying should be done with Mancozeb (2.0 g/l) or Copper oxychloride (3.0 g/l) or Bordeaux mixture (1%) or Copper hydroxide (2.0 g/l) or Fosetyl-Al (2.0 g/l) or Dimethomorph (2.0 g/l) combination of Pyraclostrobin + Metiram (2.0 g/l) or Mefenoxam + Copper hydroxide (2.0 g/l) or Metalaxyl 8% + Mancozeb. 64% (2.0 g/l) during clear weather condition.	

Live Stock Specific Advisory:

Live Stock Spec	Live Stock Specific Advisory:			
Live Stock(Varieties	Live Stock Specific Advisory			
BUFFALO	• To protect livestock from cold weather, keep the animals indoor during night hours. Provide suitable bedding like paddy straw, wheat straw, saw dust etc. of 4-6-inch thickness to protect the animals from cold. The floor of the animal shed should be kept clean and dry. Provide clean and potable drinking water to animals round the clock. Clean the water trough (once in a week) regularly in livestock. Provide mineral mixture @ 30-40 g/day to cattle for improving the milk production and reproduction efficiency.			
COW	Animals should be vaccinated against footandmouth disease.			

Poultry Specific Advisory:

Poultry(Varieties)	Poultry Specific Advisory
BIRD	• Screens on both sides of the bird shed should be closed at night and early morning during cool weather and open in the afternoon during hot weather. • The aviary should have temperature control facility. • The temperature in the poultry house should be controlled between 21 and 30 degrees Celsius, so light bulbs, grates or brooders should be used in sheds. • Electrolytes, vitamins etc. should be used in their diet to avoid stress due to climate change. • Due to extreme cold, the humidity in the air increases and fungi grow in the bird's bedding and food, and there is a high possibility of respiratory diseases in the birds, so care should be taken to keep the bedding in the bird house clean and dry. • Warm water should be provided to the parties for drinking. • Due to increased energy requirements, food should be prepared as per the advice of a nutritionist. • Get vaccinated as per schedule. • Adequate stock of medicines, saline solutions and vitamins should be kept.

Others (Soil / Land Preparation) Specific Advisory:

Others (Soil / Land Preparation) (Varieties)	Others (Soil / Land Preparation) Specific Advisory
CENEDAL ADVICE	• It should be noted that the validity of the dates mentioned in the Weather Based Advisory Bulletins will be valid up to 08:30 AM of the mentioned date. *Based on a research trial that was not included in the CIBRC label claim. # Under label claim.
CENEDAL ADVICE	• As per recommendation this month okra, cluster bean, cowpea, cucumber, pumpkin, bottle gourd,bitter gourd, dhemse, watermelon, muskmelon, spinach, radish, fenugreek and coriander should be planted. Use drip or sprinkler irrigation management.
