Wind Direction(Degree)	49	32	45	37	42
Cloud Cover(Octa)	1	1	2	3	3

Weather Summary/Alert:

• As per the blocklevel value added forecast given by, IMD, RMC, Nagpur, sky will be clear to partly cloudy during next five days i.e., 20th to 24th, January, 2024. • Weather is very likely to be dry on 20th, 21st, 22nd, 23rd and 24th, January, 2024. • No large change in maximum and temperature during next 5 days over the Vidarbha.

General Advisory:

• Considering the dry weather forecast for next 5 days it is advised to continue the harvesting and threshing of maturedpigeon pea and others crop. • Seasonal, fruits and vegetable crops should be irrigated lightly by drip irrigation/sprinkler irrigation methodto reduce the cold injury at critical growth stages. • Crops should be mulched for orchards and vegetable crops, so that it helps to increase the temperature of the soil and conserve soil moisture. • It is advised for farmers to carry out the remaining picking of cotton and terminate the crop after last picking to avoid PBW attack in next season. Collect and destroy the boll rot and diseased crop debris outside the field. • It is advised to continue the agrochemical spraying operations, intercultural operations and fertilizer application in standing crops. • For integrated management of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromone traps (Hexalur) two per acre or five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of neem extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emamectin benzoate 5 % SG 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at late jointing stage (45 to 50 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop.

SMS Advisory:

• Irrigate the crop as per crop requirement with the sprinkler irrigation system possiblyand care should be taken that the irrigation water does not accumulate in the crop field.

Crop Specific Advisory:

Crop(Varieties)	Crop Specific Advisory
GROUNDNUT	• If irrigation water is available, summer groundnut should be sown in the second fortnight of January under Broad bed furrow system and sprinkler irrigation system should be used. Use 125 kg seed per hectare of TAG-24 or SB-11 variety. Seed treatment of Trichoderma 5 gm, Rhizobium 25 gm, and PSB 25 gm should be done per kg of seed. In summer season groundnut variety TAG-24 should be sown at 30 x 10 cm and SB-11 at 30 x 15 or 45 x 10 cm for sowing.
	• Complete the harvesting of matured pigeon pea crop and store the harvested and threshed produced in safe and dry places.
GRAM/ CHICK PEA	• For optimumyield in gram crop, the first irrigation should be given 30 to 40 days after sowing i.e. when the crop is in flowering stage and the second irrigation should be given 60 to 70 days after sowing i.e. in the pod filling stage. • To prevent the occurrence of wilt disease in gram crop avoid excess irrigation to avoid water

stagnation in crop field and drenching of Trichoderma biological fungicide mixed with 40 grams per 10 liters of water should be sprayed or Trenched or thiophanule methyl 70 WP 25 grams mix with 10 liters of water should be provided management of Gram Pod Bhorer 20 bird perches per hecture. For integrated management of Gram Pod Bhorer 20 bird perches per hecture and build be interested to the moths are found in the trup for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botaticals or biological pesticides. For this, first sparying should be taken on term extract 5% or Azadractari 300 ppm 50 ml per 10 liters of water with Kanpsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Caram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Elemanette breazoles 5% 85 G 2 ml or Fliberdamide 20 % WG 5 gm or Chlorantraniliprole 18.5 S C 2.5 ml per 10 liters of water. At Wafsa condition hocing and weeding must be carried out twice, first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage water and mutrient use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing it woo irrigation should be apply at maximum lutering stage (50 to 9) days after sowing), fourth irrigation should be apply at maximum lutering stage (50 to 9) days after sowing), f	Crop(Varieties)	Crop Specific Advisory
methyl 70 WP 25 grams mix with 10 liters of water should sprayed. For integrated management of Gram Pod Borer 20 bird percises per cheatras five pit in the field. For control of gram pod borer install pheromone traps (Hexalur) two per acre or five per hectare. If eight to ten moths are found in the trup for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of neme extract 5% or Azadricatin 300 ppm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emmentin benzaute 5 % SG 3 gm or Flubendamide 20 % WC 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient tuse efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root mitation stage. Water stress at CRI stage reduces production by up to 33 % . Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing it single irrigation is available, irrigate at 21 and 65 days after sowing; the single irrigation is available, irrigate at 21 and 65 days after sowing; the single irrigation is available, and if three irrigation stage (48 to 50 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigatio		stagnation in crop field and drenching of Trichoderma biological fungicide mixed
management of Gram Pod Borer 20 bird perches per hectare should be install up in the field. For control of gram pod borer install pheromone traps, flexalur) two per acre or five per hectare. If eight to ten moths are found in the trap for three consecutive days, recommended management measures should be taken. In ease of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken of necen extract 5% or Azadiractin 300 ppm 50 ml per 10 liters of water with Kanpasok sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, apraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, apraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, apraying should be done with of the stage of the s		
the field. For control of gram pod bore install pheromone traps (Hexalur) two per acre or five phetaret. If eight to ten motis are found in the trap for three consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological pesticides. For this, first spraing should be taken of neme extract \$5 % or Azaliratian 300 pmp 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emamerchi benzoate \$5 % SG 3 gm or Fluboralamide 20 % WC 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hocing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. • Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing; but first irrigation should be apply at the flowering stage (65 to 70 days after sowing), thurf irrigation should be apply at the flowering stage (65 to 70 days after sowing), thurf irrigation should be apply at the milkly stage of the grain (80 to 85 days after sowing) to the wheat crop. I make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible cil and 1 part of broadcione 0.25 % EC 30 days after sowing), to with Thiamethoxan 25% WC 20 to 15 gm per 10 liters of water. Toxic bait should be used for ritust and passing inc		
consecutive days, recommended management measures should be taken. In case of pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botanicals or biological posticides. For this, first spraying should be taken of neem extract 5% or Azadracim 300 ppm 50 ml per 10 liters of water with Kanpsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Cram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or Emamentin benovate 5 % 65.3 gm or Flabendamide 20 % WG 5 gm or Chlorantramiliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out trivier, first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 % * Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation available irrigates at 21, 42 and 65 days after sowing, in the production of the stream of the sowing, the first stream of the stream of the sowing, the fifth irrigation should be apply at the jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. In case of infestation of aphidis in wheat crop is notice due cloudy weather, in case of infestation of paths in wheat crop is notice due cloudy weather, in case of infestation of rust and leaf blight diseases is notice spraying should be used for rat managem		the field. For control of gram pod borer install pheromone traps (Hexalur) two per
pest infestation by observing the crop or when the crop is in 40 to 50 % flowering stage, preference should be given to botamicals or biological pesticides. For this, first spraying should be taken of neem extract 5% or Azadiracini 300 ppm 50 ml per 10 liters of water with Kanpsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETIL, spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETIL, spraying should be done with Quinalphoz 52 % EC 20 ml or Emametrin herozonts 5% SG 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantramijone 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice. First at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. - Wheat crop should be irrigated first at 18 to 20 days after sowing it single irrigation is available; irrigate at 21 and 65 days after sowing it single irrigation is available; irrigate at 21 and 65 days after sowing; a single irrigation is available; irrigate at 21 and 65 days after sowing; but irrigation should be apply at maximum tillering stage (30 to 35 days after sowing), third irrigation should be apply at the flowering stage (45 to 50 days after sowing), the fifth irrigation should be apply at the milkly stage of the grain (80 to 85 days after sowing) to the what crop. - In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxan 25% WG. 20 to 15 gm per 10 liters of water. Toxic bait should be used for at management in wheat crop, it makes a possible to 40 days after sowing) to the wheat crop. - In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxan 25% WG. 20 to 15 gm per 10 liters of water. Toxic bait should be used for at management in wheat crop, it is		
stage, preference should be given to botanicals or biological pesticides. For this, first spraying should be taken or forem extract 5% or Azadiratin 300 pm 50 ml per 10 liters of water with Knapsack sprayer pump. If spraying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphos 25 % Pc 20 ml or Emamentin benzoate 5 % 86 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantramiliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hocing and weeding must be carried out twice; first at 20 and second at 30 days of plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrien use efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up 16 3%. • Wheat crop should be irrigated first at 18 to 20 days after sowing at erown root initiation stage. Water stress at CRI stage reduces production by up 16 3%. • WHEAT where the stress of the stress of the stress of the stress of the stress owing it is well irrigation is available, and if three irrigation available irrigate at 21 and 55 days after sowing. I stress owing 1 stress of the stress of the stress of the stress owing 1 stress owing 1 and town to the stress of the stress owing 1 stress owing 1 and crown root initiation stage (18 to 20 days after sowing), second irrigation should be apply at the attachment of the sowing), second irrigation should be apply at the stress of the stress owing, sound irrigation should be apply at the milty stage (45 to 50 days after sowing), fourth irrigation should be apply at the milty stage (45 to 50 days after sowing), fourth irrigation should be apply at the milty stage of the grain (80 to 85 days after sowing) to the wheat crop. • In case of infestation of applies in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalph		
liters of water with Knapsack sprayer pump. If sparying should be done with a power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinsiphos 25 % EC 20 ml or Emamectin benzoate 5 % 66 3 gm or Flubendiamide 20 % WG 5 gm or Chiorantramiliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days oft plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21 and 65 days after sowing if single irrigation is available, and if three irrigation available irrigate at 21 and 65 days after sowing, second irrigation should be apply at trown root initiation stage (18-20 days after sowing), second irrigation should be apply at transimum tillering stage (30 to 35 days after sowing). Fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of mestation of must and leaf blight diseases is notice spraying should be done of a Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic but is should be used for rat management in wheat crop. To make notice spraying should be done of a frest and should		stage, preference should be given to botanicals or biological pesticides. For this, first
power sprayer, apply three times the amount of pesticide. If Gram Pod Borer has reached the ETL, spraying should be done with Quinalphose 25 % EC 20 ml or Thumametin benzoate 5 % SG 3 gm or Flubendiamide 20 % WtG 5 gm or Chlorantramliprole 18, 52 C2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root mititation stage. Water stress at CRI stage reduces production by up to 33 %. • Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), fourth irrigation should be apply at most must alter given the sowing, then fifth irrigation should be apply at the flowering stage (45 to 50 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the flowering stage (65 to 70 days after sowing) to the wheat crop. • In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management in wheat crop. • In case of infestation of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoat 30 to 10 gm or 10 liters of water. Toxic bait shoul		
reached the ETL. spraying should be done with Quinalphos 25 % EC 20 ml or Emamentin benzoate 5 % Ro 3 gm or Flubendiamide 20 % WG 5 gm or Chlorantraniliprole 18.5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice: first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. • Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CR1 stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, and if three cirrigation available irrigate at 21 and 65 days after sowing if single irrigation is available, and if three cirrigation available irrigate at 21 and 65 days after sowing if single irrigation is available, and if three cirrigation available irrigate at 21 and 65 days after sowing, second irrigation should be apply at the control of the sowing), second irrigation should be apply at the control of a single sowing, sound in the sowing and the proper stream of the sowing, sound in the sowing, should be apply at the proper stage (65 to 70 days after sowing), fourth irrigation should be apply at the flubry stage (65 to 70 days after sowing), fourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. • In case of infestation of aphids in wheat crop is notice due cloudy weather, sowing with Thiamenthoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of micstation of rust and leaf blight diseases is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make notice spraying should be done of meets and the stream of the stream of the stream of the stream		
Chlorantramiliprole 18,5 SC 2.5 ml per 10 liters of water. At Wafsa condition hoeing and weeding must be carried out twice; first at 20 and second at 30 days of plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. **Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing; if single irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing; it is a considered at a consideration and an interest of the consideration and an interest of the consideration and an interest of the consideration and interest sowing, sound in rigation should be apply at the flowering stage (36 to 50 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing). The consideration of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxan 25% WG (£6 to 10 fg pm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop the to cloudy weather, in case of infestation of rust and leaf blight diseases is notice spraying should be done of Mancozeb 75 % WP (£6 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop, To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and loweri		reached the ETL, spraying should be done with Quinalphos 25 % EC 20 ml or
and weeding must be carried out twice; first at 20 and second at 30 days old plants to ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. Wheat crops should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing. Under the availability of adequate irrigation after sowing), second irrigation should be apply at maximum fillering stage (30 to 35 days after sowing), burth irrigation should be apply at the flowering stage (45 to 50 days after sowing), flourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the inwest stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the inwest stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the inwest stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the inwest stage of the grain (80 to 85 days after sowing) to the wheat crop. **Head of the stage of the sta		
ensure weed free environment during the critical period of crop weed competition for better water and nutrient use efficiency. *Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CR1 stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at the flowering stage (65 to 70 days after sowing), furth irrigation should be apply at the flowering stage (65 to 70 days after sowing), fourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the two the wheat crop. *In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop four to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bair, in x4 9 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water. Undertake need based irrigation schedule it at 30 days and flowering stage, for availability of two irrigations sched		
Wheat crop should be irrigated first at 18 to 20 days after sowing at crown root initiation stage. Water stress at CR1 stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing; but crown root initiation stage (18-20 days after sowing), second irrigation should be apply at crown root initiation stage (18-20 days after sowing), their fith irrigation should be apply at the flowering stage (45 to 50 days after sowing), their fith irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the wheat crop. I he case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thianethoxan 25% WG @ 10 to 15 gm or Quinalphos 25% PE 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, spray with Thianethoxan 25% WG @ 10 to 15 gm or Quinalphos 25% PE 40 ml per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25% CB. Spoon the bait into a plastic bag and place it in a live field bit on near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoata 30 EC 10 ml per 10 lit of water. Undertake need based irrigation for higher productivity in mustard. In case of availability of more irrigation schedule it at 30 days and flowering stage, for availability of two irrigations schedule it at 30 days and 10 ml per 10 ml per 10 ml		ensure weed free environment during the critical period of crop weed competition
initiation stage. Water stress at CRI stage reduces production by up to 33 %. Considering the availability of limited irrigation for wheat crop, irrigate 42 days after sowing if single irrigation is available; irrigate at 21 and 65 days after sowing if two irrigation is available; and if three irrigation available irrigate at 21, 42 and 65 days after sowing; the three irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at the stage (18-20 days after sowing), burth irrigation should be apply at the grain gateg (30 to 35 days after sowing), burth irrigation should be apply at the flowering stage (65 to 50 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. I ne case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Manoczeh 75 % WF @ 20 to 25 gm per 10 liters of water. Toxic bat is should be used for rat management in wheat crop. I make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. Cloudy weather and lowering might temperature favours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water. Undertake need based irrigation for higher productivity in mustard. In case of availability of one irrigation schedule it at 30 days and flowering stage, for availability of three irrigations schedule it at 30 days and spray and flowering stage, for availability of three irrigations schedule it at 30 days and place it in race of availability of two irrigations sched		·
Considering the availability of limited irrigation for wheat crop, irrigate 2 days after sowing if single irrigation is available, irrigate at 21 and 65 days after sowing if two irrigation is available, and if three irrigation available irrigate at 21, 42 and 65 days after sowing. Under the availability of adequate irrigation facility, first irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at take jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at the flowering stage (65 to 70 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing) to the wheat crop. • In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @ 10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for management. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancozeb 75 % WP @ 20 to 25 gm per 10 liters of water. Toxic bait should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. • Cloudy weather and lowering night temperature flavours aphid incidence in mustard. For control of aphid incidence undertake spray of Thiometon 25 EC 8 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water or Dimethoate 30 EC 10 ml per 10 lit of water to Tundertake ned based irrigation for higher productivity in mustard. In ease of availability of one irrigation schedule it at 30 days and and sowing stage, for availability of mee irrigation schedule it at 30 and 30 days interval. • Considering the dry weather forecast, undertake need based irrigation for optimum productivity in safflower. In case of availability of one irrigation schedule it at 30 and 50 days		
wheat whoat what what whoat what what wheat		
days after sowing. • Under the availability of adequate irrigation should be apply at crown root initiation stage (18-20 days after sowing), second irrigation should be apply at late jointing stage (30 to 35 days after sowing), fourth irrigation should be apply at late jointing stage (45 to 50 days after sowing), fourth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the fifth irrigation should be apply at the milky stage of the grain (80 to 85 days after sowing), the wheat crop. *In case of infestation of aphids in wheat crop is notice due cloudy weather, spray with Thiamethoxam 25% WG @10 to 15 gm or Quinalphos 25 % EC 40 ml per 10 liters of water for wanagement. In wheat crop due to cloudy weather, in case of infestation of rust and leaf blight disease is notice spraying should be done of Mancocet 75 % WP @2 to to 25 gm per 10 liters of water. Toxic batis should be used for rat management in wheat crop. To make a poisonous bait, mix 49 parts of cereal flour, a little bit of edible oil and 1 part of bromadiolone 0.25 % CB. Spoon the bait into a plastic bag and place it in a live field bin or near the bin. **Cloudy weather and lowering night temperature favours aphid incidence in mustard. 	i v
WATER MELON	• Sugar Baby, Asahi Yamato, Arka Jyoti, Arka Manik should be selected for watermelon cultivation in summer season. Apply 40 kg N, 40 kg P and 40 kg K at the time of planting. Apply 40 kg N 30 days after planting.
MUSKMELON	• Hara Madhu, Pusa Sharbati, Punjab Sunhari, Arka Rajhans, Arka Jeet, Pusa Madhuras should be cultivated for muskmelon crop in summer season. Apply 40 kg N, 40 kg P and 40 kg K at the time of planting. Apply 40 kg N 30 days after planting.
LINSEED	• Due to continuous cloudy weather condition, sucking pests can be observed, it controlled by spraying thiamethoxam 25% WG 10 to 15 gram or Quinalphos 25% EC 40 ml in per 10 liters of water.
ONION	• Six- to eight-week-old seedlings of onion crop should be planted in flat beds at a distance of 10 x 10 centimetres in the first fortnight of January.
CHILLI	• Cool, humid condition and moderate temperature favours the disease. If the incidence of leaf spot disease is observed on chilli crop, it is advised carry out the spraying of Copper oxychloride 50 % WP @ 1000 gm per acre mix with in 300-400 litre of water or Mancozeb 75 % WP @ 600-800 gm per acre mix with in 300 litres of water or Hexaconazole 75 % WG @ 27 gm per acre mix with in 200 litres of water or Kresoxim-methyl 15% + Chlorothalonil 56% WG @ 400 gm per acre mix with in 200 litres of water or Carbendazim 12% + mancozeb 63% WP @ 300 gm per acre mix with in 200 litres of water during the clear weather condition.
BRINJAL	• For management of brinjal fruit and shoot borer Spray Bacillus thuringiensis formulation (1 ml/L) at weekly interval. • Release Trichogramma chilonis @ 2,50,000/ha (50,000/release-5 times at weekly intervals, starting from flowering). Install sex pheromone traps 10/acres. • Spray Chlorantraniliprole 18.5 SC at 0.3 ml/L once in 15 days depending upon the pest population.
ТОМАТО	• If the symptoms of Late Blight of tomato was noticed due to the previous cloudy weather, spraying should be done with Mancozeb (2.0 g/l) or Copper oxychloride (3.0 g/l) or Bordeaux mixture (1%) or Copper hydroxide (2.0 g/l) or Fosetyl-Al (2.0 g/l) or Dimethomorph (2.0 g/l) combination of Pyraclostrobin + Metiram (2.0 g/l) or Mefenoxam + Copper hydroxide (2.0 g/l) or Metalaxyl 8% + Mancozeb. 64% (2.0 g/l) during clear weather condition.

Horticulture Specific Advisory

Horticulture(Varieties)

Live Stock Specific Advisory:		
Live Stock(Varieties)	Live Stock Specific Advisory	
BUFFALO	• To protect livestock from cold weather, keep the animals indoor during night hours. Provide suitable bedding like paddy straw, wheat straw, saw dust etc. of 4-6-inch thickness to protect the animals from cold. The floor of the animal shed should be kept clean and dry. Provide clean and potable drinking water to animals round the clock. Clean the water trough (once in a week) regularly in livestock. Provide mineral mixture @ 30-40 g/day to cattle for improving the milk production and reproduction efficiency.	
COW	Animals should be vaccinated against footandmouth disease.	

Poultry Specific Advisory:

Poultry(Varieties)	Poultry Specific Advisory	
BIRD	• Screens on both sides of the bird shed should be closed at night and early morning during cool weather and open in the afternoon during hot weather. • The aviary should have temperature control facility. • The temperature in the poultry house should be controlled between 21 and 30 degrees Celsius, so light bulbs, grates or brooders should be used in sheds. • Electrolytes, vitamins etc. should be used in their diet to avoid stress due to climate change. • Due to extreme cold, the humidity in the air increases and fungi grow in the bird's bedding and food, and there is a high possibility of respiratory diseases in the birds, so care should be taken to keep the bedding in the bird house clean and dry. • Warm water should be provided to the parties for drinking. • Due to increased energy requirements, food should be prepared as per the advice of a nutritionist. • Get vaccinated as per schedule. • Adequate stock of medicines, saline solutions and vitamins should be kept.	

Others (Soil / Land Preparation) Specific Advisory:
